

# Transport Dispositions

Ultimate Shipping Solutions

**ULTIMATE  
SOFTWARE**

## Key processes

Transport dispositions

Service sets

Services on transport dispositions

Vendor contracts

Booking

Port call

Round trip

Cargo load on round trip

**Transport dispositions** specify a transport leg from A to B with a specific mode of transportation. Via transport dispositions it is possible to specify cost related to that specific transport leg. Furthermore the dispositions are used to specify amount of cargo on a particular leg and to determine the cargo load on a round trip voyage, as well as loading/discharge lists per specified leg start and/or leg end.

### Templates

Templates are used by the company to specify which costs are related to the specific transport leg. The costs are specified as a service set and contains the cargo related costs. The specifications on the templates are used when generating the active transport dispositions and calculating the actual costs

### Service Sets

A service set is a template where it is possible to collect a number of different services related to the disposition.

### Services on Transport Dispositions

When a transport disposition is created it is possible for the system to search for costs related to that specific disposition. This is done through vendor contracts. One or more contracts can be related to a disposition. The system can automatically suggest a set of services to be carried out in connection with the disposition. For each service line it is possible to attach an unlimited number of resources.

### Vendor Contracts

Contracts with suppliers are entered into the system and information related to this can be retrieved when working with dispositions. On the vendor contracts a set of search criteria are setup. These are used when searching the vendor contracts for possible contracts for a transport disposition.

**Booking** handles the entry and maintenance of tasks. A task can be defined as any kind of work the company has to carry out, e.g. transport, warehouse tasks, services and fees, stowage, container handling, machine rental, discharging/loading of a vessel or a combination of these. On the Booking the desired transportation route is setup.

### Linking Booking and Transport Dispositions

When costs are to be calculated on a booking this is done by creating a link towards active transport dispositions relevant for the booking. When the relation is created, the services specified on the transport disposition are calculated on the booking with the cargo amounts specified on the booking.

### Port Call

All information about the individual port call is registered, e.g. data about arrival and departure (date, time, quay, last/next port, etc.), information about loading and discharging (port, nature of goods and quantity), shipping actions etc. and it forms the basis for calculating all port disbursements.

## Round Trip

With the Liner service functionality you can create sailing schedules and collect information related to a specific voyage. By using the Round trip functionality it is possible to handle revenues and costs and compare budget vs. actual cost and revenue per voyage.

## Cargo load on roundtrip

Active transport dispositions are related to specific load and discharge port calls. These relations are used when specifying the cargo load on board a specific voyage. Also loading and discharging lists are generated through the relation on transport dispositions.

## Dispositions

- Specify a transport leg from A to B
- Mode of transportation
- Easy use of templates to create dispositions
- Control and calculate cost for each individual transport leg
- Automatic matching of vendor contract to dispositions

## Booking and dispositions

- Setting up transportation route on the booking
- Automatically search and linking to dispositions
- Automatically creating dispositions from booking if no match is found

## Round trips and dispositions.

- Automatically specify the cargo load on a specific voyage
- Dispositions are related to specific load and discharge port calls
- Loading and discharging lists

## Services

- Fees and Duties
- Service set/templates
- Tariffs, calculation methods and calculation

## Resource handling

- Scheduling including Gantt chart
- Calculating hours
- Forecast and actual hours
- Cranes, Personnel, Vessels, Quays, Trucks, Railway, Machines etc.

## Feature Highlights

- Dispositions
- Booking and dispositions
- Round trips and dispositions
- Services
- Resource handling
